

## Important SAT100M Antenna Grounding Advisement

### *Description*

The SAT100M antenna, when installed outdoors, must be correctly grounded to protect it and the SAT100M from lightning strikes and/or static electricity created when lightning strikes nearby.

Consult a local professional in securing the antenna to the building and attaching a copper ground wire of at least #10-gauge AWG, running from the antenna (see diagram) to a properly grounded connection point outside the building.
